

Examples Excel: Introduction to formulas and functions

Consider the sheet **[04-IFF.xlsx | Exmp01]**

1. Fill the column “Valor c/ Desconto” (“Price with discount, on E3:E10), considering the discount rate of 20%
2. On cell E12 insert the formula to obtain the subtotal of the column “Valor c/ Desconto”
3. On cell E13 obtain the IVA (VAT) value, considering a rate of 5%
4. Complete the cell E14 with the formula to obtain the total sales (SubTotal + IVA)
5. The discount rate used to obtain “Valor c/ Desconto” can change frequently. Insert the value “20%” in E3 and change the formula to obtain “Valor c/ Desconto” so that the table values are automatically updated every time the value in E3 is changed
6. Create a named reference for the discount rate (named “TxDesconto”) and use it on the formula instead of the absolute reference
